

EP2/EP3

UV end position indication

Manually operated fire dampers have an additional option – end position switches which allow to send feedback about blade position to fire control panel. For each position of the blade (OPEN / CLOSE) one end switch is needed. It is recommended to order factory-fitted end position switches together with manually operated dampers.

EP2 – for fire dampers with low torque actuating mechanism (for round dampers and rectangular 2 blades dampers).

EP3 – for rectangular 1 blade fire dampers with high torque actuating mechanism only.
